## If you have heart failure, you may be able to join a research study.

### What is heart failure?

Heart failure (HF) is when the heart struggles to pump oxygen-rich blood to the rest of the body. Symptoms include tiredness, shortness of breath, and fluid buildup in the lungs, feet, and other areas of the body.

### Why is this study being done?

People with HF are at risk for other serious medical problems. The goal of COMET-HF is to find out if a study medicine can lower the risk for HF-related events, like hospitalization for HF, in people who have HF with a low ejection fraction. A low ejection fraction means the heart isn't pumping out as much blood as it should with each beat.

### You may be a good fit for this study if you

- Are an adult being treated for HF
- Have a low ejection fraction
- Have had a HF event, like an urgent care visit, emergency room visit, or hospitalization, for new or worsening HF symptoms in the past 6 months

Learn more at [COMET-HF.com](https://COMET-HF.com)

- No health insurance is required.
- There is no cost for the study medicine or study-related visits and tests.
- You may be compensated for your time and travel to study-related visits.

## How long is the study?

This study is expected to last about 3 years. COMET-HF will end after at least 850 strokes or HF-related events, like hospitalization for HF, happen across the entire group of study participants. Your study doctor will explain the length of your participation during your first study visit.

## What can I expect if I decide to join?

Talk with your study doctor about your current medications

Have in-person and video or phone call study visits

Take the study medicine or the placebo by mouth 2 times a day

Answer questions about your daily activities, symptoms, and quality of life

Contact the study team to find out if COMET-HF is right for you.
